

1. Creation of a store should be in two phases where one phase is to store details and the other phase should be Meta tags and keywords to be used for search. Example someone can search bananas in Buea
2. In the search box, when a user search a product name for example men shirts then the system should show the list of all shops selling men shirts and the at the top or at the side there should be a filter by Region, town or Quarter so that the customer can chose a specific region. When a search is done only the stores selling such products that match that category should be listed not the products and you can click on each store to view its profile and telephone number to call. Paginate the search page into a list of 20 items to be displayed per time. If keywords is not found then tell the custom to use specific words or run an errand
3. If possible add image zoomer on the photos on review so a customer can zoom and see the images
4. Prototype of search page can be seen here but instead of displaying the individual item display the store only
https://dubai.dubizzle.com/search/?keywords=laptops&is_basic_search_widget=1&is_search=1
